

Dramatically Improve your DevOps capabilities and expose the underlying metadata of your Archer instances

- ✓ **Eliminate problems promoting tested versions to production**
- ✓ **Holistically identify change impacts and focus testing on specifics instead of hoping that you've tested enough**
- ✓ **Find problems due to unintended consequences of changes**
- ✓ **Provide a complete audit trail of changes**

The CastleHill MetaDetective application interacts with the Archer API and Extended API (optional) to read, structure and output all pertinent information about your Archer Solutions

- ✓ **MetaDetective captures changes made in the instance at the Solution, Module, Level and Field level**
- ✓ **Allows for the ability to slice data captured in the MetaDetective DB using any reporting tool**
- ✓ **Captures detailed information about characteristics of modified fields**
Field level information includes layout, format, calculations, usage, rules, relationships, etc.
- ✓ **MetaDetective can be used to compare configuration details across Archer Instances (for ex. Dev to UAT, UAT to Production)**
